Yes if... (under what conditions would u say yes)11 responses

Yes if the the resident of the town would be able to see the fruit of this investments through their quality of life, and also if the cost of this investment does not outweigh the opportunity cost of using this funding for something that could benefit the town more

Yes if the funding isnt too costly. $10 a month would be my max

Depends on extra costs etc

Honestly I don't have much I would say no to, as long as it doesn't raise taxes by like 30%. Maybe being able to track exactly where they pick up from and where it gets recycled would be nice but besides that I would be okay with the

I don't understand it seems obvious because it better for the environment, leaves are decomposable so it seems like it makes the most sense. I'm sure the new method of picking them up is not all that more complicated than originally

If they make sure that this is being handled correctly

They enforce the policy and not make a mess

Collection fees cost less than what it would cost for alternative methods of obtaining compost. Also taken into account would be the length of the season and if an area gets enough fallen leaves for the program to be worth it.

I can see tangible evidence that what i am doing is beneficial to the community

Seems like an interesting way to use already there resources

As long as my life isn't in danger I'm game

Part 5: Twitter Summary

- ★ I pitched a one-season leaf-composting pilot to 21 people. 18 said yes and 3 said no (85.7%). Here's what I learned:
    - Almost nobody pushed back on the environmental case. Most people saw "leaves → compost" as obviously good, so the real question became "what does it cost me?" And, I honestly don't think many people read the "Why Not" part. I heavily emphasized how this program could burden taxpayers, public works employees, and take away funding from other programs.
    - The "yes if..." answers were basically price tags: "$10/month max," "not a 30% tax hike," "cheaper than buying compost." Their yes depended on cost or tradeoff.
    - The other big theme was proof. People wanted trackable pickups, real enforcement, and visible benefits in their town. They trust execution more than the idea which makes sense.
    - My ballot never named a price, which was intentional. Like the tree experiment in class, I wanted to see how much people would be willing to pay. So they filled in a cheap one themselves. The real tradeoff only shows up once there is a number attached, like a tax bump or a cut to roads or parks. That's where the 50-50 split probably lives.
